

Efficiency and responsibility

Safe - Efficient - Reliability

IRIS
RowCrop

The IRIS Variant boom provides a TWIN effect to ensure coverage and penetration of even the most difficult and densest crop. Each outlet is equipped with two cone nozzles placed in front of the adjustable air slot, thus creating the TWIN effect and reducing drift and loss of the product to a minimum. The three air vanes in each outlet provide sideward adjustment of the air supply, so that an even application from both sides onto each row can be made, if necessary.

The 8 outlets are mounted in the factory according to each farm's specification, meanwhile each IRIS Variant boom outlet can easily be adjusted sideways if the distance between the rows needs to be changed.

The IRIS Variant boom is operated fully hydraulically, to provide quick and comfortable height adjustment and folding of the boom. This can be done either via the joystick or directly with the hydraulic lever in the tractor.
